DETAILED ACTION

Claim Rejections - 35 USC § 112

Claim 16 is rejected under 35 U.S.C. 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention. It is unclear what "a frequency domain method" is.

Claim Rejections - 35 USC § 102

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

Claims 1, 2 and 13 are rejected under 35 U.S.C. 102(b) as being clearly anticipated by the "Admitted Prior Art as described in the applicant specification (page 3, lines 1-10)".

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

Claims 3, 4, 14-20 are rejected under 35 U.S.C. 103(a) as being unpatentable over "Admitted Prior Art as described in the applicant specification" in view of Williams (US 6,223,120). The Admitted Prior Art (APA) teaches the use of a crankshaft position, velocity and

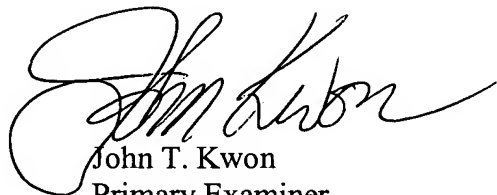

Art Unit: 3747

the acceleration of the internal combustion engine to estimate the torque is old and well known in the art (page 3, lines 1-10 in the applicant's specification). However, the APA does not show the use of a particular method to estimate model function. Williams shows that the use of a non-linear function to indicate the torque in the internal combustion engine is old and well known in the art. Since the prior art references art from the field of endeavor, the purpose disclosed by Williams would have been recognized in the pertinent art of the APA. Therefore, it would have been obvious at the time the invention was made to a person having ordinary skill in the art to modify the device of the APA by non-linear function as taught by Williams.
